

# Cricket Scoreboards

**With thousands of scoreboards installed over the past 15 years in many countries worldwide, FSL have become market leaders in electronic scoreboard technology.**

All our scoreboards are manufactured from aluminium with vandal-proof polycarbonate scorefaces for ease of installation and low maintenance. Battery and solar power versions are available for most models with portable trolley options offering complete flexibility regardless of the situation.

Self install kits are also available where budget is a restraint or it is desired to maintain the traditional look of the scorehut.

As the scoreboard is a focal point, it provides a prime location for advertisers and sponsors. In many cases the initial costs can be recouped in the first year leaving the club to reap significant revenue income from year two onwards.

Of great importance to competitor and spectator alike, we firmly believe that an FSL Scoreboard represents the best decision any club can make in enhancing it's facilities.

The Ultrabeam LCD console widely acclaimed as the most user friendly in the industry

Reduce your carbon footprint with a solar panel

FSL offer 4 types of scoreboard for cricket that offer solutions from all sizes of ground from Headingley Stadium to the smallest village green. Which model you choose will depend on a number of factors including viewing angle, viewing distance, lighting conditions, availability of power and last but not least, budget. As FSL manufactures all types of board, we have no expressed interest in any one model so will simply try and give you our best advice in helping choose the model best suited to your needs.

### 1. Electromechanical.

This is the most common and has a number of benefits including cost, low power consumption and wide viewing angle. Each digit is made up of seven segments that "flip" to change numbers. They consume extremely low power and are ideal for battery or solar operation. Although they do require more frequent maintenance to exercise the digits, this maintenance can usually be carried out by a club member offering very low maintenance costs and a typical lifespan in excess of 15 years.

### 2. Numerical LED.

These boards display the scores and/or timing with the team names displayed on a permanent sign with the home team name and visitors or slide-in changeable lettering for customised names. They use FSL's ultrabright amber LEDs and are particularly good for low level lighting conditions or floodlit matches. Cost is similar to the electromechanical types.

### 3. Alphanumeric LED.

These boards also allow the team names to be displayed. All FSL alphanumeric boards come with software that allow advertising so the board can actually generate a much needed revenue stream for the club. A further advantage is that the board can be used to communicate messages such as lost children, forthcoming matches and social events, health and safety announcements or messages from the club sponsor. FSL offer a lease option on these boards to allow the board to pay for itself from day one with no big upfront costs.

### 4. Full graphic LED with video.

These are the top of the FSL range and are most suited to larger stadiums that need to show live video for replay, etc. as well as scoring information. Once again, these are offered with custom written cricket scoring software.

Each type of board is available in various sizes depending on required reading distance. While the most common size of digits for cricket is 12", FSL offers a full range varying from 4" to 24". We will help with our recommendations when we review the required position of the scoreboard in relation to the spectators.

The method in which the scoreboard is controlled is also an important factor when choosing a scoreboard. All of FSL's numerical scoreboards are controlled by a handheld radio device, The Ultrabeam® LCD console. This allows the user to effortlessly operate the board from anywhere in the ground, even behind the board due to the built-in backlit LCD screen. This controller is widely acknowledged as the most used friendly in the industry and can be used in conjunction with leading scorebook software for direct control from a laptop computer.

Many types of portable and multi purpose models available
